

(a) noise-free: Faraday rotation winds
 χ linearly in λ^2

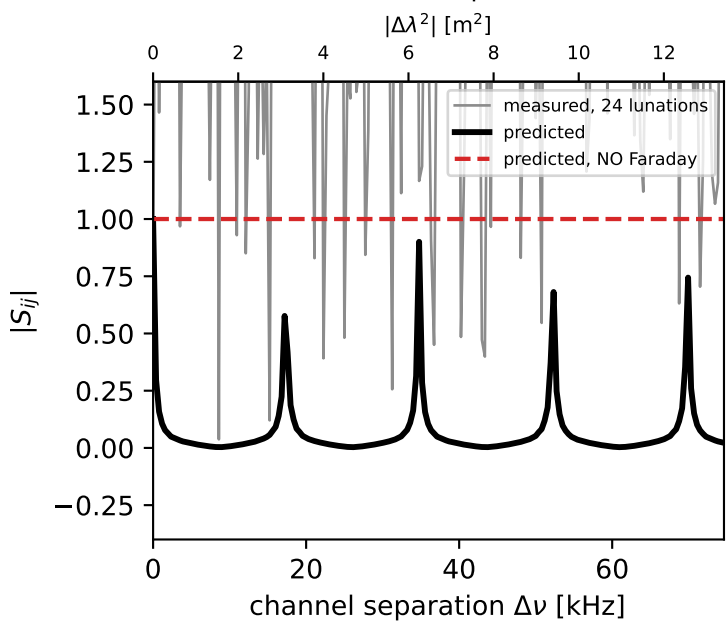

(b) noise-free $Q(\nu)$, $U(\nu)$:
 flat vs decorrelating

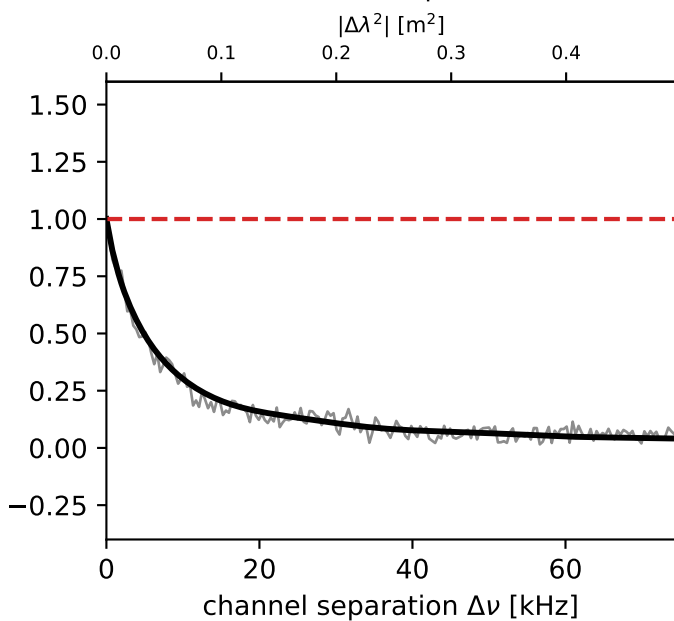

(c) ONE 2305-s sample at 30 MHz,
 slab floor: signal is $0.49\times$ the noise

(d) 10 MHz (one sample: $0.06\times$ noise)

(e) 30 MHz (one sample: $0.49\times$ noise)

(f) 50 MHz (one sample: $1.33\times$ noise)
